

Security threats are a growing issue for businesses of all sizes. There's a lot at stake—your computers and network systems, your information and your customers' data. We stay on top of the latest security hazards and employ a variety of technologies to keep all systems and data safe. At TeamLogic IT our security services ensure your business is always protected. We help by selecting, implementing, and managing IT security services for you.

Protect your business today with the following TeamLogic IT security services:

FIREWALLS

Firewalls are your first line of protection to control what comes and goes on your network system. With the right firewall protection in place, you'll be safe from malicious outsiders who can tap into your company and client data. Our security services strengthen this important gateway for your business.

SPAM MANAGEMENT

With our email security services, we protect you at all points of interaction: at your desktops, your network, and even your outside ISP, preventing unwanted spam from ever hitting your inboxes, saving your employees time and lost productivity.

VIRUS/SPYWARE SECURITY SERVICES

We protect, detect, and remove both viruses and spyware from your computer systems using best-of-breed antivirus and spyware removal applications for businesses.

CONTENT FILTERING

Content filtering lets you block websites from being accessed by users on your network. This allows you to control the websites your employees visit ensuring you're not left vulnerable to viruses, spyware and other maladies of the Web. This can also help you improve employee productivity.

SECURITY POLICY MANUALS

If you have a merchant services account, you need to be compliant with Payment Card Industry Data Security Standards. We can help by creating a customized Security Policy Manual that addresses information security for employees and contractors to keep you in compliance with credit and debit card use rules and regulations.
